

# From old Market Data to Energidataservice

This list shows data in the same groups as they were stored in the old market data, and the name of the table and the dimensions that the value is stored in the Energy Data Service. Note that the same data may be stored in several tables where it has been considered appropriate.

## Why has it changed?

The old market data was based on one large table, where all time series represented a column in the table. Any changes in data meant required changed of columns both in the table and in the user interface. This made the market data expensive to maintain and expand. At the same time, data reading (API) requires a stable structure. With the present data volume in Energy Data Service, the old solution would require more than 1000 columns. Therefore, data is divided into tables, partly based on the logical structure of data (dimensions and resolution) as well as how they are interconnected. Therefore, data contained in different tables must be collected either manually in a spreadsheet, or via SQL queries via the API.

### Annual and monthly auctions of transmission capacity across the East Danish - German border

Name, old marketsdata	Dataset in EDS	Dimensions	Shortname
Capacity sold DK-East and Germany	Auction of Capacity PTR DK2-Germany		SoldExportCapacity
