Nuvve Corporation comment on revision of battery technical standard 3.3.1:

Nuvve has no further requests for adjustments to this standard. We appreciate the careful consideration this working group has given to electric vehicles as integrated resources in the Danish electric system. This acknowledgement that a single technical standard need not be indiscriminately applied to all inverter-based devices is a significant step forward in vehicle-grid-integration that we hope will inspire similarly-nuanced new standards and reconsideration of previously established rules in Nordpool, the EU, and beyond. Energinet continues to be a leader in application of V2G technology.

Sincerely,

Jacqueline Piero
Director of Policy
Nuvve Corporation
